At the published CRISPR-Net cutoff, 19/129 missed measured-active sites qualify versus 3/21 returned sites at four mismatches; genome-wide, guide- and mismatch-matched nomination counts are 1,029/34,941 versus 187/34,941.

The tables and one command are at `code_release/genome_endtoend/`, where the checker recomputes every number above from the sequences and coordinates and a deposited script runs it on twenty-three corrupted copies: it rejects twenty-two, among them one locus repeated 34,941 times and counts moved between subgroups so that every total still agrees, and accepts one invented reference base, which needs the reference to catch.
